

# Author guidelines final report – format scientific article

## Journal of Master Forensic Science

It is expected that the final Research Project Report is written in the form of a manuscript which could be submitted to a journal. These author guidelines are adjusted from the author guidelines for the Elsevier journals Forensic Science International, Forensic Science International: Genetics, and Digital Investigation. Information not relevant for the main article (such as sub questions, methods, techniques or results not described in the article) should be added to the appendix or supplementary materials. In addition, do not explain text book knowledge in your manuscript. You can assume your reading audience consists of fellow scientists who are experts in their field.

A very good report displays a high level of understanding of the forensic context, in other words it displays a "forensic awareness" and answers questions such as "What does the forensic community need?" and "How could this innovation be used in forensic practice?". Apart from the forensic topic and a forensic relevant research question, the challenge is to write a Research Project Report that is valuable for the forensic community and might even get published.

### Article type

Research article: Original contributions in the many different scientific disciplines pertaining to the forensic sciences. Report practical or theoretical forensic research in min. 7.000 to max. 10.000 words (equivalent to about 10 to 15 pages). This is excluding the title page, tables and figures, references and supplementary materials.

### Language

Please write your text in good English (American or British usage is accepted, but not a mixture of these). To avoid unnecessary errors you are strongly advised to use the 'spell-check' and 'grammar-check' functions of your word processor.

### Lay-out

**Very important:** It is not allowed to copy the exact lay-out of a journal. For example, you should not include a main heading which is on the first page at the top of an article and it is not necessary to use two columns of written text. This could cause the impression that it is published work and that could cause copy right issues, it is also not the form in which original manuscripts are submitted to scientific journals.

### Figures and tables embedded in text

Please ensure the figures and the tables are placed next to the relevant text in the manuscript. Figures, including photographs, should be referred to in the article text as Fig. 1, Figs 2–4. References to tables should not be abbreviated, i.e. Table 1.

Figure captions: Ensure that each illustration has a caption and that the corresponding caption is placed directly below the figure. A caption should comprise a brief title (not on the figure itself) and a description of the illustration. Keep text in the illustrations themselves to a minimum but explain all symbols and abbreviations used. Number figures consecutively in accordance with their appearance in the text.

Tables: Ensure that each table has a caption and that the corresponding caption is placed directly above the table and place any table notes below the table body. Please submit tables as editable text and not as images. Number tables consecutively in accordance with their appearance in the text. Be sparing in the use of tables

and ensure that the data presented in them do not duplicate results described elsewhere in the article. Please avoid using vertical rules and shading in table cells.

### **Title page**

The following information should be stated on the front page of your report:

- title of the research project, should be concise and informative. Titles are often used in information-retrieval systems. Avoid abbreviations and formulae where possible.
- name of student and student ID,
- the number of EC,
- period during which research project was carried out,
- Master Forensic science, University of Amsterdam
- name of supervisor(s) including affiliation(s),
- name of examiner including affiliation(s),
- name of (research) institute where the project was performed,
- date of submission.

### **Headings**

The manuscript should be constructed with these main headings: Abstract, Keywords, Introduction, Material & Methods, Results, Discussion, Conclusion (optional), Acknowledgement (optional), References, and Supplementary Materials.

**Please note:** if particular sections are not applicable to a specific forensic field the guideline format can be adapted after discussion with the supervisor.

### **Abstract**

A concise and factual abstract is required of max. 350 words. The abstract should state briefly the purpose of the research, the principal results and major conclusions. An abstract is often presented separately from the article, so it must be able to stand alone. For this reason, references should be avoided, but if essential, then cite the author(s) and year(s). Also, non-standard or uncommon abbreviations should be avoided, but if essential they must be defined at their first mention in the abstract itself.

### **Keywords**

Immediately after the abstract, provide a minimum of three and maximum of 6 keywords, avoiding general and plural terms and multiple concepts (avoid, for example, 'and', 'of'). Be sparing with abbreviations: only abbreviations firmly established in the field may be eligible. These keywords will be used for indexing purposes.

### **Introduction**

State the objectives of the work and provide an adequate background of published work of relevance to your study. However, a detailed literature survey or a summary of the results should be avoided. It is not common to use subheadings in the introduction section.

### **Material and Methods**

Provide sufficient details to allow the work to be reproduced by an independent researcher. Methods that are already published should be summarized, and indicated by a reference. If quoting directly from a previously published method, use quotation marks and also cite the source. Any modifications to existing methods should also be described. You can use subheadings to structure this section.

## Results

Results should be clear and concise. State the results and draw attention in the text to important details shown in tables and figures. You can use subheadings to structure this section. Subheadings can be used to arrive at a logical order in the presentation of the results.

## Discussion

This should explore the significance of the results of the work, not repeat them. Avoid extensive citations and discussion of published literature. The discussion should point out the significance of the results in relation to the reasons for doing the work, and place them in the context of other work. You can use subheadings to structure this section. The forensic context and relevance of the work is typically part of the discussion and the same holds for recommendations for future work.

## Conclusion (optional)

The main conclusions of the study could be presented in a short Conclusions section of one paragraph, which may stand alone or form a subsection of a Discussion section.

## Acknowledgements (optional)

A brief statement acknowledging collaborators and research assistants who do not meet the criteria for authorship described above, or acknowledging funding sources, providing relevant permit numbers (including institutional animal use permits), or giving recognition to organizations that made the work possible.

## References

Please ensure that every reference cited in the text is also present in the reference list (and vice versa). Any references cited in the abstract must be given in full. Unpublished results and personal communications are not recommended in the reference list, but may be mentioned in the text. If these references are included in the reference list they should follow the standard reference style of the journal and should include a substitution of the publication date with either 'Unpublished results' or 'Personal communication'. Citation of a reference as 'in press' implies that the item has been accepted for publication.

Most journals have their reference template available in many of the most popular reference management software products. These include all products that support Citation Style Language styles, such as Mendeley and Zotero, as well as EndNote. Using the word processor plug-ins from these products, authors only need to select the appropriate journal template when preparing their article, after which citations and bibliographies will be automatically formatted in the journal's style.

There are no strict requirements on reference formatting at submission. References can be in any style or format as long as the style is consistent. Use of DOI is highly encouraged. If you do wish to format the references yourself they should be arranged according to the following examples:

### Reference style

Text: Indicate references by number(s) in square brackets in line with the text. The actual authors can be referred to, but the reference number(s) must always be given.

Example: '..... as demonstrated [3,6]. Barnaby and Jones [8] obtained a different result ....'

List: Number the references (numbers in square brackets) in the list in the order in which they appear in the text.

Examples:

Reference to a journal publication:

[1] J. van der Geer, J.A.J. Hanraads, R.A. Lupton, The art of writing a scientific article, J. Sci. Commun. 163 (2010) 51–59.

Reference to a book:

[2] W. Strunk Jr., E.B. White, *The Elements of Style*, fourth ed., Longman, New York, 2000.

Reference to a chapter in an edited book:

### Supplementary materials

Besides the main results described in the article an appendix/supplementary materials should be added covering everything which could not be included in the main article, such as:

- research (sub)questions arising from the project which are not covered in the article (including those of which the results failed, or of which the results are irrelevant for the final conclusion in the supplementary materials);
- all used methods and techniques not described in the article;
- discussion of discovered results, which are not relevant to the final conclusion;
- tables and figures covering data details that are too extensive to be included in the article.

Please submit your material together with the article and supply a numbered (e.g. Appendix 1, or A1, A2 etc.), concise, descriptive caption for each supplementary file.

### Research data

Journals often encourage and enable you to share data that supports your research publication where appropriate. Research data refers to the results of observations or experimentation that validate research findings. To facilitate reproducibility and data reuse, journals often also encourage you to share your software, code, models, algorithms, protocols, methods and other useful materials related to the project. Discuss with your supervisor and examiner how to make sure that the research data remains available after finishing your project.
